Even if explicitly stated to the contrary, nothing in this posting should be construed as representing my employer's opinions.

snort

Sorry to make you snort this morning – hope you didn't have a mouthful of coffee at the time...

What do you want/need on the system? Are you compiling, and/or running a d/b, and/or running apache, or do you have some proprietary bloatware that eats resources?

Well, ultimately, what I want to do with this machine (once I see if I can add some memory and perhaps get a bit larger disk drive) is to a) use it with a wifi card to surf the internet, b) compile some C applications, c) do some development in Tcl.

RE: Forking the discussion – attempting to update a laptop running redhat... RE: Any Certified Laptops In The Future

Remember, you can still d/l a linux that runs on a 486, and maybe even
a 386.

Hmm – I don't think I ever knew that, so I can't remember it. Perhaps
there is some place a level 1 novice can go to learn the basics like
that?
