

Migrating mailman lists from Ubuntu to Fedora 7

I am trying to get my mailman config on a Fedora 7 box working after migrating the lists from my old Ubuntu server. Basically I installed the mailman rpm and then copied my archives over. The listinfo page shows my lists, but when I click on the link for a particular list, I get a 404 error. The exact error is:

The requested URL /cgi-bin/mailman/listinfo/wchs82 was not found on this server.

I have tried to verify my httpd config, and it looks right. The config file for mailman (/etc/httpd/conf.d/mailman.conf) shows these ScriptAliases:

ScriptAlias /mailman/ /usr/lib/mailman/cgi-bin/
and
Alias /pipermail/ /var/lib/mailman/archives/public/

If I cd to these locations, the directories are there. I am wondering whether I put stuff in the right places when I copied it from my old system.

There is no mailman in the /var/www/cgi-bin, but there wasn't on my old system either. Any suggestions?

Vicki
