Jerry,

You have done nothing wrong and you are not alone! Both Todd (using RHEL 5.0) and I (using CentOS 5.0) have come across it – see our earlier postings to the list.

It is a RedHat problem and I do not know a solution. I am waiting for the CentOS 5.1 updates to become available and from them I will be able to see if RedHat have fixed it. As a RHEL 5.0 user, why not post a bug report to RedHat?

Regards,
Alan.

Thank you Geoffrey,

That's very easy to reproduce it from my side.

1. just get kernel-2.6.18-8.el5.src.rpm from any official site.
2. unrpm it, and `make all' by default configuration.
3. re-make again to issue these warnings.

I am not sure if you can reproduce it from your side.
but seems that I didn't do any customized modification.

RE: How can I fix the kernel warning

That's a pretty tricky question you're asking. I know I'd have to replicate such an Error before I can start looking at fixing it!

Subject: How can I fix the kernel warning

HI, all

with the rhle5 kernel 2.6.18

when I compiled a new module with the current kernel, I got following warnings

How can I fix it?

Building modules, stage 2.
MODPOST
WARNING: vmlinux - Section mismatch: reference to
.init.data:boot_params
from .text between '_text' (at offset 0x80400029) and 'startup_32_smp'
