Check out using Kerberos and Openldap. Your users will get authenticated via Kerberos and authorize using Openldap.

I'm not adding kerberos to the mix. All I'd like, since several folks have posted excellent links towards letting the users change their own ldap passwords is a way to get openldap to age them, and I haven't seen anything on that yet.

I'm just looking into password aging using openldap, and would appreciate if anyone had a link or links to a FAQ, Howto, or discussion that does *\*not\** end in "but that's a question for another mailing list...."

What I have is this: one server with local passwords, and all the others are using openldap. Ideally, I'd like to a) age passwords, and b) allow users to change their LDAP password without me needing to get the encrypted passwords from them and then do an ldapmodify....
