

openldap 2.3 on RHEL 4 – users changing their own passwords?

Source: <http://linux.derkeiler.com/Mailing-Lists/RedHat/2008-02/msg00060.html>

I finally got openldap 2.3 built and working, and now I'm trying to let users change their own passwords. Everything I find on the 'Net wants the admin password, something that's obviously not going to happen.

Does anyone know what I need to do to enable this?

The ACL from my slapd.conf is:

<snip>

access to *

by * read

olcAccess: to attrs=userPassword

by self write

by anonymous auth

by dn.base="cn=root,dc=att,dc=com" write

by * none

<snip>

openldap 2.3.39

mark
