Scott:

Have you taken a look at phpSyslog-ng? The link is below.

<http://code.google.com/p/php-syslog-ng/>

I am testing splunk as a logging server on a CentOS 5 box which is accepting connections from client linux and Windows systems, the clients using snare agent.

My goal is to have a relatively easy-to-configure web-based log viewer to present events from all systems in one interface, letting me sort by different methods, and is not *_that_* difficult to set up. If I want to review the events of all systems in one file, then I should be able to click a link and see all events. I should be able to sort by Windows vs Linux, or time, or success/failure of object or logins, etc.

If splunk can do all this, it hasn't been obvious from my tests thus far (using free download from their site). What other linux-based logging server apps are available, preferably for free, but if not, at least offer free trials?

Thanks.

Scott
