Just came from another session of installing SuSE8.2 on a friend's computer (it's interesting how many people are really interested in trying it out lately). Ran into a bit of a problem though. While I was explaining and demonstrating how to mount, unmount and eject a CDROM using KDE, it failed. A message pops up complaining that the device is busy and it will not unmount it.

What I've checked;

- all applications that may be accessing the mount point are exited.
- the check box for Konqueror performance (where it keeps Konq preloaded) is unchecked.

If you wait 5 mins or so without doing anything, you eventually can unmount and eject the CDROM. It would seem that whatever is hanging on to the mount point eventually lets go. Or, I can do a `umount -l /media/cdrecorder` and force the issue. Neither option is really acceptable to a newbie user.

Any ideas or suggestions for what to look for?

C.
