To: suse-linux-e@suse.com

I have SLES 7 installed with Kernel 2.4.7 and am having some problems when trying to run the Lansafe UPS monitor daemon.

Weeks ago, I had installed and verified Lansafe III and then Lansafe V. I left a working Lansafe V daemon running on the system. I know it was working, but yesterday, I noticed that I did not see any evidence of it running, so I tried to re-start the program. I got a segmentation fault. I uninstalled the software, and then re-installed it. The installation reported no errors, but attempting to start the daemon produces the segmentation fault. I un-installed again, then removed anything referring to the software from rc.config and inittab. I installed a fresh download of Lansafe III, (which had previously worked), but get a segmentation fault with it as well.

It seems that something has changed with my system, and I wonder if anyone might have experienced something like this. In the period of time between being able to run Lansafe and now, I have been working with Samba, and I have also tried (unsuccessfully) to change from BSD printing to CUPS.

I would greatly appreciate any advice as to what might possibly be different in the system that could cause such a problem.

Thanks.

Mat
