Well the memtest (thanks for pointing that out, I had forgot) checked out fine, ran for a couple of hours to be sure. I however had some strange lockups when accessing a LVM partition on a 40GB disk on my RAID card. The machine worked fine under SuSE 8.1 then I totally disassembled it, put in a raid card, removed

32GB clip jumper, added ram, changed CPU (Celeron 433 to PII 450) reassembled and installed SuSE 8.2. Strange part was after removing the jumper partitions were still found and SuSE 8.1 started somewhat working. (Found that out by having wrong boot order when installing)

Is this a Disk/CPU/raid-card error? Guesses welcome.

Did you check your memory with memtest86?

I think if you did not yet, then it is time now.
