Hi:

Using SuSE 8.2 Pro.

I just installed a CableFree access point and a PCMCIA card to my notebook. The access point is connected to my network's switch, and setting this hardware took less than 10 minutes. I can ping my server, and I can connect to the exported NFS the server has. I can transfer files back and forth. All the boxes that are using a cable can connect to the Internet. Even my notebook, using a cable, can connect to the Internet. If I open a terminal window, and issue "dig clshonduras.com" I will get the information on that site. But if I try to browse the web with Konqueror or Mozilla, I get a "cannot connect to <http://www.clshonduras.com>" or any other site. If I try to ping a site on the internet, I get a "Network Unreachable" message. Could somebody tell me what else I need to do?

Thank you.
