In a recent thread I saw mention of using a "lock" file with spamassassin.

I don't use fetchmail, procmail etc (at least nothing that I've configured) , just lowly kmail to download and read my mail. (don't have time or the need to learn about fetchmail, procmail etc, right now).

I set up a filter in kmail to use spamc to sort out spam mails and its working well – except for the horrible slowdown while spamc does its job.

I've read the spamassassin docs but I don't see any info about how to setup a "lock" file, especially in conjunction w/ kmail.

Can this be done with kmail? If so how.

Part of the thread discussing lock files is quoted below...

```

As I'm only using kmail I have no ~/.procmailrc file.

Thanks

dh
