If your sendmail/qmail is already running thru amavis you will never see these viruses in Kmail (unless kmail is popping some other site other than your own machind) because the virused mail will already be detected and sequestered by amavis.

If you want to pop other sites and scan them it would be better to use fetchmail and pass them all thru sendmail/qmail for virus and spam scanning rather than waiting to do it after they hit your kmail.

If you are reading your mail with Kmail, why worry about viruses anyway? They won't hurt you.
