With Suse 7.2 I compiled kernels many time with no problem

With Suse 8.2 every attempt has been a disaster, luckily I have a 2nd install on a removeable hard disk for tinkering, dabbling and learning...

I've followed the Admin guide instructions to the letter, but no luck.

One question: in 7.2 the "make bzlilo" seems to do more than rename the kernel to .old and copy the map file, is that an area I should look at? I am using GRUB.

The latest attempt resulted in: Kernel panic:VFS:unable to mount root fs on 03:43

I compiled the reiserfs support into the kernel, not as a module. (but I have tried modules as well)

so what am I doing wrong?

Thanks,

Charles
