Hi.

I have made an upgrade today using Synaptic on my 8.2 system. After I forgot to run the 3 -4 lines, that I cannot remember what is now :-(

But after a reboot, I'm receiving the following:

```
kernel (hd0,5) /boot/vmlinuz root=/dev/hda6 vga=0x317 hdd=ide-scsi hddlun=0
splash=silent splash=silent hdc=ide-scsi
```

Error 15: File not found

I can do failsafe start up.

What can I do to get the 8.2 to carry on ?.

/Erik.
