Hi,

** This is for your information **

** No disrespect---I am a Mandrake user for yrs -- usually no problem doing this on MDK---still practising & learning Suse **

While practising on a spare HD I installed with rpm a kernel.....on Suse 9.0...like...

rpm -Uvh k_athlon-2.4.21-121.rpm.

(yast and I do not understand each other yet).

Ok after install & reboot I was not able to my *little know-how* to get the system going.

So I thought re-install...then I saw & took the option repair...auto repair...some interaction up to finish and reboot ...the OS is running on new kernel now.

I like that - :)

I am sure there should be an easirer way?

Thanks

Johan

May this be a good day for learning
