I have download suse 9.0 I gave had to install twice now. Here is what is happening. I get everything up and going. I get into KDE update Suse and play around for a while. everthing seems fine and then all of a sudden something happens that causes me to reboot. This last time Konqueror was not responding. When I reboot the login screen is all gray with a concole log window in the corner and when I log in I don't goto KDE I have an all gray screen. The login screen doesn't have any options and I don't know what happened.

Is it something with X?? I did download and install the latest Nvidia driver for Linux which seemed to work fine. I installed that so I could enable 3d acceleration. But if it was that how come it worked for hours after I restarted. I played games and browsed and stuff np.

Very frusterated :-s
