Hash: SHA1

I'm trying to build KDevelop 3 beta 1 on my SuSE 8.2 Pro for the first time. When I run `.configure`, I get an error message that it can't find Berkely DB > 3. I have installed Berkely DB 4, and it is present in `/usr/local/BerkelyDB.4.2/`

I've looked at the archives for KDevelop, and I can see that various people have been hitting this since last May. I've tried using `--extra-includes` and `--extra-libs` on the `.configure` line, but it still doesn't find my BerkelyDB

I'm pretty sure some of the people here have installed KDevelop 3. As you're on the same distro I have, you probably hit the same problem. Can any of you give me an idea of how to continue?

tia
