Having successfully used ht://dig to produce a search db i have come across a minor hiccup when running it that I have failed to solve and have now run out of ideas!

The engine runs fine as cgi-bin/htsearch, however the output page specifies its image URI as the relative "images/htdig.gif", for example.

As set up by default (with the images directory as www/htdig/images) this results in no images displayed. I have tried copying the images dir to many places to try and restore them but to no avail, none of the following seem to work:-

[www/cgi-bin/images](#)

[www/images](#)

[www/htdocs/images](#)

I suppose the real question is, what is a relative URI branched from when you call a cgi-bin file?

Anyone have any ideas please?
