I hope someone knows the answer to this, and I suspect that many have the same problem. First, the hardware, which is an Epson Stylus Photo 2200, which will print up through 13"x19, or roll fed. I'm using SUSE 9.0.

Printing is GREAT with Gimp, although the preprocess to the spooler is VERY slow. Gimp can work with roll stock or sheet stocks, and has them all listed when you choose what the print is to be printed on. Now, OO, KWord, nor any other application has Super B (13"x19") listed, nor 11"x17", nor roll stock, etc. ALL apps REFUSE to print properly on Super B, choosing to print 8.5"x11". Using Yast to config the printer deffs, there's NO problem defining the printer stock sizes, etc., thus the entire system SHOULD use the same info.....logically anyway. There appears to be something inherantly wrong in Linux, as others on a newsgroup have the same problem.

Any solution? Thanks,

Fred
