I have a Canon i950 USB printer on my SLP 9.0 i388 systems that I have been printing with using turboprint for months. Since my update, I have not been able to print. The system doesn't even see /dev/usb/lp0 until I go to YaST->Hardware->Printers and then it finds it in a device probe. A hardware scan via YaST->Hardware->Hardware Information doesn't even see it until I bring up the YaST printer dialog.

Once recognized I still cannot print. It looks like it loads the USBLP module and then looks at the parallel port! My system is dual-booted with MaxiTrash 98 and Win98 is able to print to it fine.

Anyone have a similar problem or a fix? Thanks.

The relevant /var/log/message output is:

```
