Hi, all −−

I have a new e−Machines desktop and a Belkin 802.11b wireless NIC that doesn't appear to be recognized. I've just gone through the 9.0 setup and passed the network config on the way to creating users, and my 'wireless settings' button is greyed out.

Has anyone any experience with such a beast and could point me to how to light up this card?

TIA & HAND

:−D
