First item:

I installed 9.1 on a ASUS A7N8X-E Deluxe(BIOS 1009) using Installation Failsafe from the DVD. I boot using GRUB with `acpi=off adm=off hdc=cdrom ide=nodma` and the others parameters. The ASUS A7N8X-E is listed as being fully supported in the SUSE hardware support list. All the restrictions make me think there is something wrong with the distribution's support of this system board.

Second item:

9.1 boots correctly except after the first update.

When I do an Online Update, LINUX halts or appears to halt just after the fsck on the partitions is performed the "done" is not printed. The next item normally seen in the boot dialog "Setup" is not seen. I see listed all the ext2 and ext3 partitions but I did not see the root partition listed as being checked. I don't know if that may be normal.

I choose all the "recommended" item on the yast online update list. Some tell me if there is anything I can do.

I'm in a big hurry as this project is way behind.
