Not really sure what you meant by this but if you have obtained a site certificate from a trusted Certificate Authority (CA) like VeriSign, GeoTrust, etc., usually they'll tell you what to do with it...

If you have no idea what the above is all about, try googling for "configure apache ssl". I'm sure you'll find something that would give you an idea about the process.

Just replace the ones (test certificates) you have now.
(/etc/apache2 ?)
