```

I had to change the gfx card in my SUSE 9.1 system after the old one died. The swap was replacing a GeForce FX5200 with my old GeForce2 MX400.

Now the replacement was very painless − a sax during the initial boot detected the new card with no problems. However, the display resolution seems to have changed − all fonts are smaller than before.

Where is this information hidden in KDE? I managed to change my Gnome resolution to match the KDE one, but I don't know how to convince KDE to use the old setting!

John
