Check the installation source in yast:

Software -> Change Source of Installation (Check for version 9.2 and remove any previous sources)

"rpm --rebuilddb" on the command line. That should rebuild the rpm database.

Fire up yast and check again for missing and clashing packages.

Also you can check the packages "amavisd-new" in yast. The button [Information] -> [Package Relations] will give you a list of the required packages. The list is quite long. I suggest you rebuild the rpm database, check if you can now detect missing dependencies in the system and then reinstall amavisd-new.

There are a LOT of dependencies!!

Haven't seen such a button but I am still using Suse 9.1 only as a server installation via ssh.

Good luck! I would hate to reinstall my system from scratch. Are there any more buggy services on your system, critical i
