I'm having similar issues with SuSE 9.2 (from a clean install with patching up to date).

My HD is on an Highpoint ATA-100 (/dev/hdg) and my CDROM (/dev/cdrom) is on a regular IDE. I've had the identical problem with Fedora Core 3 as well on this box.

In my case grip creates the mp3 folder, starts to create the wave file, creates the album directory for the resulting mp3 and starts to create an mp3. The resulting files are only a few kb small (incomplete) and the process seems to hang. When I try to exit Grip, the dialogue box claims grip is still busy.

I have another box with a more conventional drive layout which seems to work fine.

HD on IDE (/dev/hda)
CDROM on IDE (/dev/cdrom)

Perhaps the problem may have to do with the extra controller.

I'd be interested if anyone has found a work-around.

Marcel
