I cannot seem to get Postfix to masquerade my mail by replacing @server.i.am.on to @my.real.domain by entering in the required field in the Yast MTA.

If I set up aliases for each user on the machine (user->user@my.real.domain) then it works fine, but not globally.

The Yast sidebar and Postfix instructions suggest I am doing the right thing, but obviously not.

Is there some other switch I need to set that Yast is forgetting?
