Just for the record and FYI – I found the cause of at least one major problem, and possibly more. SuSE 9.1 ships with the BerkeleyDB built incorrectly!

As shipped, It will only support DB\_PRIVATE operations, which causes problems with amavisd and possibly nmdb and postfix.

You need to recompile BDB 4.2.52 (that version specifically, unless you also want to recompile nmdb and postfix) with `--enable-cxx` and NOT `--enable-posixmutexes`.

You may also need to recompile perl-BerkeleyDB.

I've no idea is other distros also suffer from the same problem. Try 'db\_stat -c -h /path-to/a-database' and if it errors out with "BerkeleyDB is compiled to only support LD\_PRIVATE operations' – you have a problem.
