To: SLE <suse-linux-e@suse.com>

I have a Windows application that needs to run on a SuSE 9.2 box.
It installs without problems and seems to work fine, except for printing.

The printer dialogue detects the CUPS printer and all seems fine until you print. Then the CPU usage goes up to 100% and the procs goes through the roof.

The only way to stop it is to kill wine. Then a very huge print job appears in teh queue. The side depends on how long you wait before you kill wine.

I have had one job of size 256MB.

I cannot find any help by googling.

Has anybody had a similar problem or a solution?

Thanks
