hi folks

i was trying to install Novell Linux Desktop on a P4 , 845 chipset ,  
20GB Maxtor Hdd, 128mb ram with Win98 already installed on complete  
20GB of the disk of which only 4gb was used .

first the system was defragmented in win98. then started the NLD  
installation and resized the HDD to 14GB and 5 GB free space was  
created for Linux . but during resizing process it showed 40% complete  
and kept on listing directories it was processing for almost 1.5 hrs  
and then the system froze with constant hdd and cdrom activity.  
finally after 2.5 hrs when the system was rebooted windows had been  
corrupted, the system was not resized.

any idea what could have caused this ? earlier i have resized boxes  
installed with win2k / winxp etc without any errors

any help is appreciated

Harsh
