To kde I'll assume. Same here, except by accident from console 1.

Thus the problem. It is working, but it does not mean it is in the Yast hardware database. Once it is there, it will not prompt unless something changes (and it won't even if something changes if susepluggger can't run, i.e. since you renamed them).

What does it show for the NIC in Yast>Hardware>Hardware Information?

Just running it seems to create new unique keys, so that might solve your problem. Hope so. :-)

>What do you sugest, that I start as root again, say ok to new hardware

>found, "a la windows", allow it to proceed and perhaps break something

>that is already working?

Not necessarily, just that the fact the module loads and the card works doesn't mean it is "found" hardware as far as Yast is concerned (though since that is what Yast was supposed to do it should have).

> Can't just I say, good doggy, now be good and

>shut up?

I'm sure you can. I was just pointing out that susepluggger is quiet for all users once it has "found" all present hardware. It will only prompt a "new" user about new hardware if there is new hardware. If you made sure it was all "found", that puppy WOULD be quiet. My point was there was another way to shut it up, which was IIUC the designed way.
