Hi all,

I setup a web server for hosting with SLES9 and Apache2. All works well, and we have a couple of sites on it already, but as the number of sites increase, so does the need to be able to throttle or cut off certain sites.

I need to do the following:

1. Assign a quota to a site, say 300mb per month or something like that
2. When a site reaches thte quota, disable the site, maybe redirect to a page stating the site is over quota or something like that.
3. Be able to offer different amounts of bandwidth to a site, say 64kbits/s to one site and say 1mbit to another.

It seems the essential module, `mod_throttle`, has not been ported to Apache2 yet. Can anyone point me to the appropriate documentation to achieve this?

Thanks

Hans
