Sorry I had originally sent this to the wrong list.

Good Afternoon,

I had sent in an earlier message about trying to login and getting dropped from a W2000 workstation. I received a reply back to upgrade Samba from 3.013 to 3.020x. I did this.

Operating System: SuSE 9.3
Samba Version: 3.0.20a (SuSE's RPMs)

I am using /etc/samba/smbpasswd file and not LDAP to store the users and passwords.

[global]

```
passwd chat debug = Yes
passwd chat = *password* %n\n *password* %n\n *changed*
socket options = TCP_NODELAY
logon drive = P:
interfaces = 127.0.0.1 192.1.51.0/255.255.255.0 eth1
hosts allow = 192.168.51.0/24 127.0.0.1
hosts deny = ALL
domain master = Yes
log level = 2
log file = /var/log/samba/log.%m
max log size = 50
debug timestamp = yes
username map = /etc/samba/smbusers
map to guest = Bad User
encrypt passwords = yes
logon home = \\%L%\%U\9xprofile
passdb backend = smbpasswd
```

[SLE] [Fwd: [suse-imap-e] Problems with smbpasswd, account_policy_get: tdb_fetch_uint32 failed for field

[Fwd: [suse-imap-e] Problems with smbpasswd, account_policy_get: tdb_fetch_uint32 failed for field 4 and logging in to th

```
; printer admin = @ntadmin, root, administrator
passwd program = /usr/bin/passwd %u
wins support = yes
printcap cache time = 750
netbios name = smb
cups options = raw
printing = cups
logon script = logon.bat
unix password sync = True
local master = Yes
workgroup = CMC
logon path = \\%L\profiles\.msprofile
os level = 65
printcap name = cups
security = user
add machine script = /usr/sbin/useradd -c Machine -d /var/lib/nobody
-s /bin/false %m$
domain logons = Yes
name resolve order = wins lmhosts hosts bcast
; name resolve order = lmhosts hosts bcast
dns proxy = yes
```

I then went back to the drawing board and started to run the samba tests. On the windows client, I received a "System error 1326 has occurred" message when I attempted the net use x: \\server\username. The English translation of the message was "Login Failure: unknown user or bad password". I googled this and rightfully or wrongfully, I thought that maybe there was a problem with the passwords (<http://archives.free.net.ph/message/20040131.202546.2961584d.en.html>).

I attempted to change the password of the user using smbpasswd and I received a dialog similar to this:

```
# smbpasswd <username>
```

New SMB password:

Retype new SMB password:

```
account_policy_get: tdb_fetch_uint32 failed for field 4 (maximum
password age (seconds since 1970)), returning 0
```

```
account_policy_get: tdb_fetch_uint32 failed for field 5 (minimum
password age (seconds since 1970)), returning 0
```

So I wondered if this was caused by the change from 3.0.13 to 3.0.30a. See <http://lists.samba.org/archive/samba/2005-April/103603.html>. I used webmin to delete the user from /etc/samba/smbpasswd and it worked. I then attempted to do a smbpasswd -a <username> and I got the same error as above.

I cannot add users to the system nor can I login into the domain.

Please help. Thanks in advance,
