I just purchased a 9800 pro graphic card and I'm having trouble getting 3D to work.

I went to ATI and loaded the installer program and on reboot the computer wouldn't init level 5. Ran Sax2 and got my 2D graphic back.

(Note that during the installation I did not have the graphical ATI pics that the site shows, looked more like Yast in console)

I then went back to the ATI site and downloaded the RPM for my system and installed it with Yast, again upon reboot had to run Sax2 again to come to level 5

When I open a shell window and type "fglrxconfig" it starts working I quit after it asked for the name of my mouse (PS2) witch I couldn't find.

So basically I have two questions first what all does fglrxconfig want to know and if I go through the questions will 3D work or must I reinstall the RPM and run fglrxconfig from a failsafe boot?

Thanks for your replies in advance  
Paul Ryan
