Okay guys, I get the hint!!! ;-) Just frustrated, that's all!

Basically, the problem is that my signal drops between my machines and the router (Linksys WRT54G v.3). Signal drops and then it picks it back up again after 5–90 seconds. After a series of these drops, the ap is lost altogether. After an active scan, I may or may not find the ap, and even if the ap is found and I connect "successfully", I'm not able to find the name servers again.

I've gone through most everything that I've found, using the how-to's, guides, and posts. I'm still testing a few things with the pci cards –and– the wireless router. Since my original post, all I've done since, I'm leaning toward router problems. I'll get back in a couple of days.

Re: [SLE] Linksys WMP54G & SuSE 9.3 Pro problems (was: Bombproof...)

Thanks,

Bernd
