I also have Verizon DSL. It depends partly on if he's getting static or dynamic IP address. If it's static, there's no modem setup - plug it in and configure your firewall. If it's a dynamic IP address, the procedure isn't too different, but you'll need to make a few settings to the modem using a browser - it's all www based. Verizon support is actually pretty good, so you shouldn't have too much trouble with the settings. They do use several different modems though, so you'll pretty much have to go to their support people. One bit of urgent advice I'll give you though - set up a caching DNS as soon as you can - the response times on Verizons are lousy.

Mike-
