Why not *\*safely\** allow access via ssh, instead?

Start sshd

ok, I have that, then I look into security-firewall settings.  
I see SSH under allowed services for selected zone. There are 3 choices, internal, external and DMZ. which ones need to be open. Both of my machines are behind a router, then the DSL modem.  
I see the eth0 is only setup on the external zone, so I guess that answers that question...

open ssh on firewall 22/tcp/udp & 614/tcp/udp

every time I try to add TCP port 22 and 614 it says OK, then the summary only shows port 614, not 22. UDP shows both 614 and 22, I don't get it. I tried adding "22 614" and "614 22" both failed.

then ssh for access and scp to copy files.

I love winSCP !
