I don't know what could be causing this and why it's (so far)
manifested
only when trying to access this particular site / address, but
clearly
the checksum generation is the problem.

I'm by far a guru here, and still waiting on my boxed 10.2, but I
wonder
if any of you have tried dial-up (modem0) vs your eth0 interface...?
All I can say at this point is it workes here, and is a very
interesting
problem...

What I can say so far: in the company, where I have a proxy between my
Suse box and this specific server, it works. So it seems to be a problem
caused by two 'incompatible' tcp stacks. Very nice thing to find in the
net.

Re: [opensuse] unable to access website after 10.2 install

I'll stay a bit on it.
