Hello,

I have suse 10.2 with latest kde 3.5.6 packages from repos.opensuse.org.
Before I start kpdf with 1.7MB large pdf file, X-org process has 80MB of
ram. When I scroll down pdf, Xorg has 650MB of ram. Looks strange...
Is there anybody with same issue???

m.

With any pdf file or just a specific one?

of course with any file...

thanks, m.
