I have tested a lot different formats:

Excellent list!

P.S. I have already spent a lot of time getting this partial conclusion, would be very appreciated if someone provide more insightful suggestions or correction!

I've asked a friend who may know something but I don't have a reply yet.

P.S. "mkisofs -J" do not allow file names with more then 64 characters. If you do have such long named files, unfortunately there is no known way you can archive them and deliver to Windows user while ensure the file name not corrupted.

Have you tried this option:

"-joliect-long
Allow Joliet filenames to be up to 103 Unicode characters. This breaks the Joliet specification – but appears to work."

Cheers, Dave
