In my continuing quest to get bytecode Truetype fonts (Tahoma) rendered correctly under 10.2 and OpenOffice 2.1 (as it was on 10.0), I have recompiled the freetype-1.3.1 lib.

Looking for the enable define for bytecode interpreter I found that it was already enabled. ie in ft_conf.h.in

```
#undef TT_CONFIG_OPTION_NO_INTERPRETER
```

Did openSUSE pay Apple for this – the default is suppose to be disabled? or am I missing something.

Whatever the answer, it still does not work for OpenOffice 2.1; Tahoma menu fonts, under 18px, renders horribly (rest of the system is fine).

I did check with ldd that soffice.bin links against the new libfreetype.so.
