Hi,

FYI,

since Firefox 2.0 times, I was unlucky and unhappy. I never could use firefox stably on Linux.

Any cure like disabling extensions and creating new profiles, and following the mozilla hints to stabilize firefox was done, to no avail. Instead the "would you like to restore the previous session" box made my life more "colorful"

Since the last suse build on my 32bit Box, ff could never survive 10 Minutes of surfing the web.

I got so frustrated that I for one changed to opera and secondly deleted all the suse firefox stuff and installed the new 2.0.0.3 release directly from mozilla.com.

What can I say, now after a full day of surfing the the web with mozillas firefox and another full night of downloading a few GB of downloads (the latter was just for testing, normally I do not use firefox for such things), I am still using the very same incarnation of firefox that I started yesterday!

A definitive improvement and much more related to the linux reputation of being rock solidly stable. ;-))

Recommended to anyone having similar problems with firefox.

kind regards
Eberhard
