Thu, 24 May 2007, by tuxebe@xxxxxx:

Hi,

I am looking for an app that makes my CPU as hot as can be.

Download and burn UBCD.

That has a good collection of tests for (almost) every piece of hardware you can think of.

In the mean time, here's something that keeps the CPU busy for a bit:

```
/*  
* load50.c -- a simple busy-looping tool.  
*  
* Obviously, this runs with any kernel and any Unix  
*/
```

```
#include <stdio.h>  
#include <stdlib.h>  
#include <unistd.h>
```

```
int main(int argc, char **argv)  
{  
int i, load=50;  
  
if (argc==2) {  
load=atoi(argv[1]);  
}  
printf("Bringing load to %i\n",load);
```

```
for (i=0; i<load; i++)  
if (fork()==0)  
break;
```

```
while(1)
```

Re: [opensuse] how to burn my cpu?

Re: [opensuse] how to burn my cpu?

```
;  
return 0;  
}
```

I picked it up on news many moons ago, don't remember the author.

Theo
