Hello

I've bought a new monitor Benq FP202W. I've got a VGA Asus Nvidia 6600. After installation Nvidia driver when i switch to command line (ctrl+alt+F1), monitor has got blurred picture. It is impossible to read, so i can't work in command line—it is unusable. And when i turn off pc, blue splash screen is blurred also.

I hope you understand me, what i mean.

For better explanation I'd like to make a screenshots of command line, but i don't know if it possible and how.

Up to now i had Prestigio P1710 and it worked fine.

Regards, Rasto

Hello,

This problem is well known and is discussed on the nvidia forums :

<http://www.nvnews.net/vbulletin/forumdisplay.php?s=e7a0c7b6751c176fae127134c5e2cf1f&f=14>

It is known to happen when you have a TV connected at boot, this limits the framebuffer resolution

at 800x600. So delete any vga=xxxx at boot and it should work.

Michel.
