Tearing out my hair on this one...

A few months ago, a new kernel caused printing to freeze the system, but I don't think that's related (have tried all BIOS settings; one-way, ECP, EPP).

The first symptom was (your not going to believe it) Firefox tabs quit responding to the mouse. (That seemed to be fixed after replacing the motherboard... but, I'm getting ahead of the story.)

System started hanging a few weeks ago. No error messages... just hangs tight. I was playing w/ some new hardware and had to power-cycle a lot, so I figured I killed some HW.

I removed a processor... didn't fix it; replaced the running processor, with the one I took out... didn't fix it.

I tried running one stick of RAM at a time... didn't fix it.

Removed all peripherals, swapped video cards, disabled USB, printer, and serial in the BIOS, replaced the SCSI card, replaced SCSI w/ IDE (same image)... didn't fix it.

Replaced the motherboard, with new processors... didn't fix it.

Put all the PCI adapters/devices/video disks on a newer Intel motherboard... it works... no hangs!

Did you change the power supply?

Nick
