Google showed it may be a restriction of NFS V2 though why that is now running is another mystery. rpcinfo and nfsstat shows that server and client are both running both v2 and v3. I haven't been able so far to find out which version is in use for a particular mount. How can I do that?

Just by chance, I found this. I think 'cat /proc/fs/nfsfs/servers' or '...volumes' will do:

```
NV SERVER PORT USE HOSTNAME
v3 c0a8010c 801 1 nimrodel.valinor
```

```
NV SERVER PORT DEV FSID
v3 c0a8010c 801 0:19 fefbab737c720323
```
