1) The sound on my laptop is pretty poor. I bought a pair of logitech usb speakers: They work fine under windows. However, in opensuse 10.3 they are recognised, but I get no sound through them. I can select them through kmix but adjusting the control there does nothing for it. If I press the volume increase button on the side of the speaker and the laptop displays a volume window set to 11%. Repeated pressing doesn't change anything however pressing the decrease button displays volume set to 0%. I'd be really grateful if someone had any idea how to get them working or could point me in the direction where I can get some help.

2) My laptop has a built-in card reader. Is there anything I can do to get linux to detect and use it? Again it works well under windows.

Thanks very much, in advance.

Eddie
