Hi all,

I need to control my CPU fan speed. I replaced my older fan with a new one, that is faster than the old one, and much louder!. Normally reducing the speed in relation to CPU temperature does the trick to reduce the noise.

I managed to install sensors and get sensors-detect to get the chip. I even got the KDE Ksensors running its "Dashboard". What could now be used to control the fan speed?

System is OpenSUSE 10.3 with a motherboard using Chip driver it87.

TIA

:~)

Al
