

OpenOffice document recovery connecting to internet server--Security concern?

Hi

I just started up OpenOffice (on Ubuntu 5.10) and it prompted me to recover a document from a crash. Thinking that this was odd, because I didn't recall an OpenOffice crash the last time I used it, I went ahead and attempted to recover the document.

The document recovery proceeded very slowly. I also noticed lots of network activity via the Network Monitor on my Gnome panel. Quickly, I fired up tcpdump (sadly I didn't have ethereal installed) and saw lots of connections to port 80 at the following host:
port-64-1954021-zzt0prespect.devices.datareturn.com

I immediately killed the process--it wouldn't stop from the gui--and when I did, the network traffic stopped as well.

I think this is very odd, as I can't imagine why OpenOffice would be behaving this way. If it were a windows computer, I would assume it had been compromised in some way.

Has anyone seen anything like this before? Should I be worried?

Thanks
