Consider learning how to use it. It is an **invaluable** tool for users of any UNIX-based system. (don't give in and use EMACS :) though I shouldn't strike up the holy wars) It's actually quite simple when you start to learn how it's used, and you'll be zipping around files with such speed that you'll surprise yourself.

It still shouldn't be made to the default. Users that are capable of using vim will have no problem changing their editor.

Similarly, I love LaTeX and think it produces far better documents than OpenOffice.org, but I'm not about to propose that Ubuntu drop OO.o in favor of Lyx or gedit+teTeX.

Re: ubuntu-users Digest, Vol 19, Issue 175

SO now I just have the default spam filter enabled, and all my mail is being tagged as spam. On the other hand, if I isolate a single

message

and run spamc on the ocmmand line, e.g:

```
cat ~/.evolution/mail/local/test | spamc -R
```

I get very good results (non-spam has very low scores, spam has very high scores). Has anyone else dealt with this issue? Can you suggest

a

solution?

Purge or move aside the "~/.spamassassin" directory, and edit "/etc/default/spamassassin" to make sure that "ENABLED=0" is there (the package default is 0). In other words, don't run a system wide SA.

Use the default spam checking from Evolution, which will start up a private instance of spamassassin running as your own login id, and then access it via 'spamc'.

if I understand you correctly, I should no longer need to do this, as the automatic spam-checking should now work.

Don't try to pretrain the SA, but when messages are not matched as spam, click the Junk button.

missed this message earlier in the month, thank you for your response, will try this! Didn't realize that evolution started a private spamassassin instance.

I've been using a bogofilter filter that I saw in a forum somewhere, and it works pretty well (catches about 90% of spam, very few false positives) , but as far as I can see there's no way to train bogofilter from within evolution. So I'm hoping your suggestion gives me a better solution

also, is there a reason I shouldn't try pretraining?

thanks much,

matt

When remote connecting to a XP system the account you are connecting to must have a password set up on it.

Ah thanks ! :-)
I added a password to my account, now I can connect to it ! :o)

It works well except for one strange show stopper...

- 1) First, I log into my XP account
- 2) In Ubuntu I open an RDP session
- 3) I can see the Windows desktop and control it.
- 4) however as soon as the session is started, windows logs me out !!!
- 5) I log back again in windows
- 6) When I have done that, now it's the Ubuntu remote desktop session that exists/closes all of a sudden !

It doesn't log you out, it locks the screen. That is the normal and expected behaviour. Remote desktop isn't designed for you to take control of the other user's session and let them watch you. It is a form of terminal services that allows you to connect to your own machine remotely. Remote assistance is Microsoft's protocol to allow you both to be able to watch the session. However, there is no linux client that I'm aware of. (granted, I've never looked.) For what it sounds like you're wanting VNC is your best bet.

Windows does have some perks. One being it is easy to setup everything.
The
downside is ofcourse all the security holes and it being a major target
for
spyware and viruses. I don't know how linux compares in the spyware and
virus
part since I have only been using linux for about 3 weeks now. I do
believe
that linux is making me a better trouble shooter though since a lot of
things
are harder to setup.

Hmm, thanks for shedding some light Roger, I am starting to make sense of windows behaviour now, it does have some logic to it in the end ;o)
So I guess what I would be asking for, in the future, is that Gnome Terminal Server Client applet, handles this " Remote Assistance" protocol of Windows. I might file a wishlist bug about it, in case it's not already in their pipeline...

Re: ubuntu-users Digest, Vol 19, Issue 175

Content-Type: text/plain; charset=ISO-8859-1

Hey all.

So I tried to move to Dapper, and got this when running apt-get dist-upgrade:

```
Unpacking openoffice.org-help-en-us [...]
dpkg: error processing
/var/cache/apt/archives/openoffice.org-help-en-us_2.0.2-1ubuntu2_all.deb
(--unpack):
trying to overwrite '/usr/lib/openoffice/help/en/default.css', which
is also in package openoffice.org-help-en
dpkg-deb: subprocess paste killed by signal (Broken pipe)
Errors were encountered while processing:
/var/cache/apt/archives/openoffice.org-help-en-us_2.0.2-1ubuntu2_all.deb
E: Sub-process /usr/bin/dpkg returned an error code
```

As a result, I can't make progress, and my box is in a horribly broken state. Suggestions, anyone?

...I don't know how linux compares in the spyware and virus part since I have only been using linux for about 3 weeks now.

I am still a newbie as well, but with a little longer experience, but the result is very encouraging :

- Been using Linux for nearly 2 years, and the past 18 months with Ubuntu since the day it came out. Connected to internet 24/7 for all of that time, receiving 100+ mails every day (mostly via this very list ! ;-), surfing the web hours a day, no anti-virus, no fire-wall, yet I have not ever had any spyware, virus or any sort of malware, and the web browser easily blocks ugly ad banners effortlessly as well. So in short, it's a dream.

- I installed Windows XP this morning (had a little thing to do/test on it). After only 30 minutes on the web (not kidding!), I got a pop up window steal focus, telling me my computer was infected and I needed to take immediate action. Then it started to pop-up internet Explorer windows all over the place, with flashy porn/sex/games ads, the more windows I closed, the more that would pop up ! After 3 minutes clicking everywhere, it eventually calmed down, and all IE's windows were eventually closed. 3 minutes later, it started all over again !! :-O

Re: ubuntu-users Digest, Vol 19, Issue 175

So really, I hardly even remotely consider going back to Windows, even if someone paid me for it.

Sure enough, Linux (on the Desktop) has many rough edges as it's still such a battle field and is moving so quickly as it matures and all its numerous bits and pieces are being developed/debugged. But the strong, positive points of Linux faaaaaaar out weight any quirk you might come across.

Have fun :-)
